

Oxytocin Inhibitors

The present invention relates to a class of substituted amides with activity as Oxytocin inhibitors, uses thereof, processes for the preparation thereof and compositions containing said inhibitors. These inhibitors have utility in a variety of therapeutic areas including sexual dysfunction, particularly premature ejaculation (P.E.).

The present invention provides for compounds of formula (I)

wherein:

R¹ is selected from:

- 15 a) phenyl, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, CF₃, halo, CN, NR⁷R⁸, OCF₃, SOR⁶, SO₂R⁶ and OC₁-C₆ alkyl, wherein said alkyl group may be optionally substituted by a C₃-C₈ cycloalkyl group, and
- 20 b) Aromatic Heterocycle, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, NH₂, CF₃, halo, OH, OC₁-C₆ alkyl, SR⁶, SOR⁶, SO₂R⁶, NR⁷R⁸ wherein R⁸ may be optionally substituted by NH₂, phenyl or Heterocycle, and OPh wherein Ph may be optionally substituted by 1-3 groups each independently selected from halo and C₁-C₆ alkyl;

R² is selected from:

- a) phenyl, which is optionally substituted by C₁-C₆ alkyl, halo, CN, NR⁷R⁸, OC₁-C₆ alkyl, OCF₃, CF₃ and SO₂R⁶,
- b) OPh, which is optionally substituted by C₁-C₆ alkyl, halo, OC₁-C₆ alkyl, OCF₃, CF₃ and SO₂R⁶,
- c) C₃-C₈ cycloalkyl which is optionally fused to phenyl,
- d) Aromatic Heterocycle,
- e) R⁶,
- f) C(O)NR⁶R⁶, and
- g) Heterocycle, which is optionally substituted by C(O)R⁶;

R³ is selected from:

- a) phenyl, said phenyl being optionally fused to Heterocycle and said phenyl or said fused phenyl being optionally substituted by 1-3 groups each independently selected from: C₁-C₆ alkyl, CF₃, halo, CN, OCF₃, SO₂R⁶ and OC₁-C₆ alkyl,
- b) Heterocycle,
- c) R⁶,
- d) 3-8 membered cycloalkyl group, which is optionally substituted by C₁-C₆ alkyl, and
- e) Aromatic Heterocycle, which is optionally substituted by C₁-C₆ alkyl;

R⁴ is hydrogen or CH₃;

R⁵ is selected from:

- a) CONH₂, CONHR⁶, CONR⁶R⁶, R⁶, NH₂, NHR⁶, OH, OR⁶, OC(O)NHR⁶, NHC(O)H, NHC(O)R⁶, and
- b) Aromatic Heterocycle, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, NH₂, CF₃, halo, SR⁶, OH, OC₁-C₆ alkyl, NHR⁶ wherein the R⁶ moiety may be optionally substituted by phenyl or Heterocycle, and OPh wherein Ph may be optionally substituted by 1-3 groups each independently selected from halo and C₁₋₆ alkyl;

R⁶ is C₁₋₆ alkyl;

R^7 is hydrogen or C_1-C_6 alkyl;

R^8 is C_1-C_6 alkyl;

5

or NR^7R^8 forms a monocyclic saturated ring system containing between 3 and 7 ring atoms;

x is 0, 1 or 2,

10 y is 0, 1 or 2, and

z is 0, 1 or 2, and

wherein:

Aromatic Heterocycle may be defined as a 5-6 membered aromatic heterocycle

15 containing 1-4 heteroatoms each independently selected from N, O and S, said ring optionally fused with a phenyl or a 3-8 membered cycloalkyl group;

Heterocycle is a 5-8 membered saturated or partially saturated ring containing 1-3 heteroatoms each independently selected from N, O and S, said ring optionally

20 fused with phenyl.

The pharmaceutically acceptable salts of the compounds of the formula (I) include the acid addition and the base salts thereof.

25 A pharmaceutically acceptable salt of a compound of the formula (I) may be readily prepared by mixing together solutions of a compound of the formula (I) and the desired acid or base, as appropriate. The salt may precipitate from solution and be collected by filtration or may be recovered by evaporation of the solvent.

30 Suitable acid addition salts are formed from acids which form non-toxic salts and examples are the hydrochloride, hydrobromide, hydroiodide, sulphate, bisulphate, nitrate, phosphate, hydrogen phosphate, acetate, maleate, fumarate, lactate, tartrate, citrate, gluconate, succinate, saccharate, benzoate, methanesulphonate, ethanesulphonate, benzenesulphonate,

p-toluenesulphonate and pamoate salts.

Suitable base salts are formed from bases which form non-toxic salts and examples are the sodium, potassium, aluminium, calcium, magnesium, zinc and
5 diethanolamine salts.

For a review on suitable salts see Berge et al, J. Pharm. Sci., 66, 1-19, 1977.

The pharmaceutically acceptable solvates of the compounds of the formula (I)
10 include the hydrates thereof.

Also included within the present scope of the compounds of the formula (I) are polymorphs thereof.

15 Also included within the present scope of the compounds of the formula (I) are atropisomers thereof.

A compound of the formula (I) contains one or more asymmetric carbon atoms and therefore exists in two or more stereoisomeric forms. Where a compound of the
20 formula (I) contains an alkenyl or alkenylene group, cis (Z) and trans (E) isomerism may also occur. The present invention includes the individual stereoisomers of the compounds of the formula (I) and, where appropriate, the individual tautomeric forms thereof, together with mixtures thereof.

25 Separation of diastereoisomers or cis and trans isomers may be achieved by conventional techniques, e.g. by fractional crystallisation, chromatography or H.P.L.C. of a stereoisomeric mixture of a compound of the formula (I) or a suitable salt or derivative thereof. An individual enantiomer of a compound of the formula (I) may also be prepared from a corresponding optically pure intermediate or by
30 resolution, such as by H.P.L.C. of the corresponding racemate using a suitable chiral support or by fractional crystallisation of the diastereoisomeric salts formed by reaction of the corresponding racemate with a suitable optically active acid or base, as appropriate.

Unless otherwise indicated, an alkyl or alkoxy group may be straight or branched and contain 1 to 8 carbon atoms, preferably 1 to 6 and particularly 1 to 4 carbon atoms. Examples of alkyl include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, pentyl and hexyl. Examples of alkoxy include methoxy, ethoxy, isopropoxy and n-butoxy.

5

Unless otherwise indicated, a cycloalkyl or cycloalkoxy group may contain 3 to 10 ring-atoms, may be either monocyclic or, when there are an appropriate number of ring atoms, polycyclic. Examples of cycloalkyl groups are cyclopropyl, cyclopentyl, cyclohexyl and adamantyl.

10

Examples of Aromatic Heterocycle are furyl, thienyl, pyrrolyl, oxazolyl, thiazolyl, imidazolyl, pyrazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, triazolyl, thiadiazolyl, pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl, tetrazolyl, triazinyl. In addition, the term heteroaryl includes fused heteroaryl groups, for example benzimidazolyl, benzoxazolyl, imidazopyridinyl, benzoxazinyl, benzothiazinyl, oxazolopyridinyl, benzofuranyl, quinolinyl, quinazolinyl, quinoxalinyl, benzothiazolyl, phthalimido, benzofuranyl, benzodiazepinyl, indolyl and isoindolyl.

15

Examples of Heterocycle are oxiranyl, azetidiny, tetrahydrofuranyl, thiolanyl, pyrrolidinyl, pyrrolinyl, imidazolidinyl, imidazolinyl, sulfolanyl, dioxolanyl, dihydropyranyl, tetrahydropyranyl, piperidinyl, pyrazolinyl, pyrazolidinyl, dioxanyl, morpholinyl, dithianyl, thiomorpholinyl, piperazinyl, azepinyl, oxazepinyl, thiazepinyl, thiazolinyl and diazapanyl.

25

Halo means fluoro, chloro, bromo or iodo.

Unless otherwise indicated, the term substituted means substituted by one or more defined groups. In the case where groups may be selected from a number of alternative groups, the selected groups may be the same or different.

30

Preferably R^1 is selected from:

- a) phenyl, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, CF₃, halo, CN, NR⁷R⁸, SO₂R⁶ and OC₁-C₆ alkyl, and
- 5 b) Aromatic Heterocycle, wherein said Aromatic Heterocycle is selected from pyridyl, pyrazinyl, pyrimidinyl, quinolinyl, quinoxalinyl, isoxazolyl and pyrazolyl, each aromatic heterocycle optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, SR⁶, SO₂R⁶, NH₂, CF₃, halo, OH, OC₁-C₆ alkyl, NR⁷R⁸ wherein R⁸ may be optionally substituted by NH₂, phenyl or Heterocycle, and OPh wherein Ph may be
- 10 optionally substituted by 1-3 groups each independently selected from halo and C₁-C₆ alkyl.

More preferably R¹ is selected from:

- a) phenyl, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, CF₃, halo, CN, NR⁷R⁸, SO₂R⁶ and OC₁-C₆ alkyl, and
- 15 b) Aromatic Heterocycle, wherein said Aromatic Heterocycle is selected from:
- i) pyridyl, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, SO₂R⁶, NH₂, CF₃, CN, halo, OH, OC₁-C₆ alkyl, NR⁷R⁸ wherein R⁸ may be optionally substituted by NH₂, phenyl or Heterocycle, and OPh wherein Ph may be optionally substituted by 1-3 groups each independently selected from halo and C₁-C₆ alkyl;
- 20 ii) pyrimidinyl, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, SO₂R⁶, NH₂, CF₃, CN, halo, OH, OC₁-C₆ alkyl, NR⁷R⁸ wherein R⁸ may be optionally substituted by NH₂, phenyl or Heterocycle, and OPh wherein Ph may be optionally substituted by 1-3 groups each independently selected from halo and C₁-C₆ alkyl;
- 25 iii) pyrazinyl, which is optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, NH₂, SR⁶ and halo;
- 30 iv) quinolinyl;
- v) quinoxalinyl, which is optionally substituted by OH;

- vi) isoxazolyl, which is optionally substituted by 1-3 groups each independently selected from: C₁-C₆ alkyl; and
- vii) pyrazole.

- 5 Yet more preferably R¹ is phenyl, 2- or 3-pyridyl or 2,4-pyrimidinyl, said moieties being optionally substituted by 1-3 groups each independently selected from C₁-C₆ alkyl, halo, OC₁-C₆ alkyl, CN, SO₂R⁶, NHR⁷, NHCH₂CH₂NH₂ and CF₃.

- Most preferably R¹ is phenyl, 2- or 3-pyridyl or 2,4-pyrimidinyl, said moieties being
- 10 optionally substituted by 1-3 groups each independently selected from methyl, fluoro, chloro, methoxy, ethoxy, n-propoxy, CN, SO₂CH₃, NH₂, NHCH₃, NHCH₂CH₂NH₂, and CF₃.

Preferably R² is selected from:

- 15 a) phenyl, which is optionally substituted by C₁-C₆ alkyl, halo, OC₁-C₆ alkyl, OCF₃, NR⁷R⁸, CF₃ or SO₂R⁶,
- b) OPh, which is optionally substituted by C₁-C₆ alkyl or halo,
- c) cyclopropyl or 1- or 2-indanyl,
- d) pyrazolyl, which is optionally substituted by R⁶,
- 20 e) R⁶,
- f) C(O)N(CH₃)₂, and
- g) 5-6 membered saturated ring containing 1 nitrogen atom, said ring being substituted by C(O)R⁶;

- 25 More preferably R² is selected from:

- a) phenyl, which is optionally substituted by methyl, halo, methoxy, CF₃ or SO₂CH₃,
- b) cyclopropyl or 1- or 2-indanyl,
- c) pyrazolyl, which is optionally substituted by methyl,
- 30 d) C(O)N(CH₃)₂, and
- e) piperidiny substituted by C(O)R⁶;

Yet more preferably R² is selected from:

- a) phenyl, which is optionally substituted by methyl, fluoro, chloro, methoxy, CF_3 or SO_2CH_3 ,
- b) pyrazolyl, which is optionally substituted by methyl, and
- c) $\text{C}(\text{O})\text{N}(\text{CH}_3)_2$.

5

Most preferably R^2 is phenyl, *para*-fluorophenyl, *para*-chlorophenyl, *para*-methylphenyl, 2,5-dimethylphenyl, *o*-methylphenyl and *para*-methoxyphenyl.

Preferably R^3 is selected from:

- 10 a) phenyl, said phenyl being optionally fused to Heterocycle and said phenyl or said fused phenyl being optionally substituted by 1-3 groups each independently selected from $\text{C}_1\text{-C}_6$ alkyl, halo, CN and $\text{OC}_1\text{-C}_6$ alkyl,
- b) R^6 ,
- 15 c) cyclopropyl, cyclobutyl, cyclopentyl or cyclohexyl, which is optionally substituted by $\text{C}_1\text{-C}_6$ alkyl; and
- d) Aromatic Heterocycle, wherein said Aromatic Heterocycle may be defined as a 5-6 membered aromatic heterocycle containing 1 or 2 nitrogen atoms, said ring optionally fused with a phenyl or a 3-8
- 20 membered cycloalkyl group.

More preferably R^3 is selected from:

- a) phenyl, said phenyl being optionally fused to 1,4-dioxan and said phenyl or said fused phenyl being optionally substituted by 1-3 groups each
- 25 independently selected from $\text{C}_1\text{-C}_6$ alkyl, halo, CN and $\text{OC}_1\text{-C}_6$ alkyl;
- b) R^6 ,
- c) cyclopropyl, which is optionally substituted by $\text{C}_1\text{-C}_6$ alkyl; and
- d) Aromatic Heterocycle, wherein said Aromatic Heterocycle is selected from pyrazolyl or pyridyl, both optionally substituted by $\text{C}_1\text{-C}_6$ alkyl.

30

Yet more preferably R^3 is selected from:

- a) phenyl, said phenyl being optionally fused to 1,4-dioxan and said phenyl or said fused phenyl being optionally substituted by 1-2 groups each

independently selected from methyl, methoxy, ethoxy, fluoro, chloro and CN;

- b) isopropyl;
- c) cyclopropyl; and
- 5 d) pyrazolyl and pyridyl, both optionally substituted by methyl.

Most preferably R^3 is selected from 3-methoxyphenyl and 1,4-benzodioxanyl.

Preferably R^4 is H.

10

Preferably R^5 is selected from: $CONH_2$, $CONHR^6$, $CONR^6R^6$ and R^6 ;

More preferably R^5 is $CONH_2$ or CH_3 .

- 15 Most preferably R^5 is $CONH_2$.

Preferably R^6 is methyl.

Preferably x is 1.

- 20 Preferably y is 0.

Preferably z is 0 or 1.

Most preferably z is 0.

- 25 Preferably, Aromatic Heterocycle may be defined as a 5-6 membered aromatic heterocycle containing 1-3 heteroatoms each independently selected from N, O and S, said ring optionally fused with a phenyl or a 3-8 membered cycloalkyl group.

More preferably, Aromatic Heterocycle may be defined as a 5-6 membered

- 30 aromatic heterocycle containing 1-2 heteroatoms each independently selected from N, O and S, said ring optionally fused with a phenyl.

Preferably, Aromatic Heterocycle is selected from pyridyl, pyrazinyl, pyrimidinyl, quinolinyl, quinoxalinyl, isoxazolyl and pyrazolyl.

Heterocycle is a 5-8 membered saturated or partially saturated ring containing 1-3 heteroatoms each independently selected from N, O and S, said ring optionally fused with phenyl.

5

Preferably, Heterocycle is a 5-6 membered saturated ring containing 1-3 heteroatoms each independently selected from N, O and S.

10 Preferably, Heterocycle is a 5-6 membered saturated ring containing 1 nitrogen atom.

15 All of the above reactions and the preparations of novel starting materials using in the preceding methods are conventional and appropriate reagents and reaction conditions for their performance or preparation as well as procedures for isolating the desired products will be well-known to those skilled in the art with reference to literature precedents and the Examples and Preparations hereto.

20 Compounds of formula (I) where R^1 , R^2 , R^3 and y are as described above, x is 1, z is 0, R^4 is H and R^5 is CONH_2 may be prepared by the following process as described in Scheme 1:

Scheme 1

Compounds of formula (I) may be prepared by reacting compounds of formula (II),
 5 (III), (IV) and (V), where R^7 may be H or Ph, under the conditions of process step
 (a) Ugi 4 component condensation – the acid, amine, aldehyde and isonitrile are
 reacted together to give the desired compounds using the method of Keating, T. A.
 and Armstrong, R. W., J. Am. Chem. Soc. (1995), 117(29), 7842-3.

10

Typically – the acid, amine, aldehyde and isonitrile are stirred together in a suitable
 solvent such as methanol, ethanol, THF, Et₂O, DME, DMF, DMSO at a temperature
 of 0 °C to the reflux temperature of the solvent for 1 – 48 hours. The mixture is
 then treated with an acid such as HCl, H₂SO₄, AcOH in a suitable solvent such as
 15 methanol, ethanol, THF, Et₂O, DME, DMF, DMSO at a temperature of 0 °C to the
 reflux temperature of the solvent for an additional 1 – 48 hours.

Preferably – a mixture of the acid, 1.1 equivalents of the amine and 1.0 equivalents
 of the aldehyde in methanol was treated with 1.0 equivalents of (4-isocyano-3-

cyclohexen-1-yl)- benzene (Baldwin, J. E.; O'Neil, I. A. Tetrahedron Lett. (1990), 31(14), 2047-50) and the mixture was stirred at room temperature for 18 hours. The mixture was then heated to 50°C for 4 hours. The cooled mixture was treated with CHCl_3 in THF (7% by volume) and stirred at room temperature for another 18 hours.

Compounds of formula (VI) and (VII) are also produced as by products of process step (a)

Compounds of formula (VI) may be converted into compounds of formula (VII) and subsequently transformed into compounds of formula (I).

- It will be understood by one skilled in the art, that the Ugi 4 component condensation sometimes forms the acid (VII) directly without the intermediacy of the ester (VI). This is believed to be due to the formation of a münchnone intermediate which is trapped by water, Keating, T.A.; Armstrong, R.W. J. Am. Chem. Soc. (1996) 118, 2574. The relative proportions depend primarily upon the starting materials used. However, certain conditions may be used in process step (a) to increase the relative proportions of (VII) to (VI):

Typically – the acid, amine, aldehyde and isonitrile are stirred together in a suitable solvent such as methanol, ethanol, THF, Et_2O , DME, DMF, DMSO at a temperature of 0 °C to the reflux temperature of the solvent for 1 – 48 hours. The mixture is treated with an acid such as HCl, H_2SO_4 , AcOH or acid chloride such as acetyl

chloride in a suitable alcoholic solvent such as MeOH or EtOH, the choice of alcohol dictating the ester that is ultimately formed

- Preferably – a mixture of the acid, 1.1 equivalents of the amine and 1.0 equivalents of the aldehyde in methanol was treated with 1.0 equivalents of the isonitrile and the mixture was stirred at room temperature for 18 hours. The mixture was then heated to 50°C for 4 hours. The mixture is treated with 5.0 equivalents of acetyl chloride and heating continued for 4 hours.
- 10 As discussed above, compounds of formula (I) where R^1 , R^2 and R^3 are as described above, x is 1, y is 0, z is 0, R^4 is H and R^5 is CONHR^6 or CONH_2 may be prepared from compounds of formula (VI) and (VII) by the following process as described in Scheme 2:

Scheme 2

Compounds of formula (VII) may be prepared by reacting compounds of formula (VI), under the conditions of process step (b) Ester hydrolysis – the ester can be treated with either an acid or a base, with heating in a suitable solvent to effect the hydrolysis. Alternatively, if R^7 = benzyl, the ester can be removed by hydrogenolysis using an appropriate catalyst.

10 Typically – the ester is treated with a metal hydroxide (Li, Na, K) in an aqueous solvent, MeOH, EtOH, THF, dioxan at a temperature of 0 °C to the reflux temperature of the solvent for 1 – 48 hours.

15 Preferably – a methanolic solution of the ester was stirred at room temperature for 18 hours in the presence of approximately 3 equivalents of aqueous sodium hydroxide.

20 Compounds of formula (I) may be prepared by reacting compounds of formula (VII), under the conditions of process step (c) Amide bond formation – such reactions may be carried out under a wide variety of conditions well known to the skilled man.

Typically – the carboxylic acid may be activated by treatment with an agent such as CDI, TFFH, or a combination of reagents such as PyAOP and HOAt, or by the

intermediacy of the acid chloride, for example prepared by the use of oxalyl chloride and catalytic DMF. Alternatively, the reaction may be carried out by the addition of a peptide coupling agent such as HATU, or HBTU, or DCC or DIC to a mixture of the acid and amine. The reaction is carried out in a suitable solvent such as DCM, pyridine, DMF, DMA or NMP at a temperature of 0 °C to the reflux temperature of the solvent.

Preferably – equimolar amounts of the acid and amine, 1.1 equivalents of HBTU and 2-4 equivalents of DIPEA in DMF were stirred at room temperature for 18 hours.

Compounds of formula (I) where R^1 , R^2 , R^3 and y are as described above, x is 1, z is 0, R^4 is H and R^5 is CONHR^6 may be prepared by the following process as described in Scheme 3:

Scheme 3

Compounds of formula (I) may be prepared by reacting compounds of formula (II), (III), (IV) and (VIII), where R^8 may be H or Ph, under the conditions of process step (a) Ugi 4 component condensation as described herein.

- 5 Typically – the acid, amine, aldehyde and isonitrile are stirred together in a suitable solvent such as methanol, ethanol, THF, Et₂O, DME, DMF, DMSO at a temperature of 0 °C to the reflux temperature of the solvent for 1 – 48 hours.

- 10 Preferably – a mixture of the acid, 1.1 equivalents of the amine and 1.0 equivalents of the aldehyde in methanol was treated with 1.0 equivalents of the isonitrile and the mixture was stirred at room temperature for 18 hours. The mixture was then heated to 50 °C for 4 hours.

- 15 A variety of methods are obvious to one skilled in the art for the preparation of isonitriles of formula (VIII). For example the isothiocyanate can be converted into the corresponding isonitrile using 3-methyl-2-phenyl-[1,3,2]oxazaphospholidine according to the method of Mukaiyama, T; Yokota, Y. Bull. Chem. Soc. Jpn., (1965) 38, 858 or the polymer-supported equivalent of Ley, S.V.; Taylor, S.J., Bioorg. Med. Chem. Lett. (2002) 12(14), 1813. Alternative preparations of
20 isonitriles include the methods of Weber, W.P.; Gokel, G.W., Tet. Lett. (1972) 1637, of Ugi, I Angew. Chem. Int. Ed. Engl. (1965) 4, 472 and of Creedon, S. M. *et al*, J. Chem. Soc. Perkin Trans. 1 (1998), 1015.

- 25 Compounds of formula (I) where R^1 , R^2 , R^3 , R^4 , z and y are as described above, x is 1 and R^5 is $CONR^6R^6$ may be prepared by the following process as described in Scheme 4:

Scheme 4

- 5 Compounds of formula (XI) may be prepared by reacting compounds of formula (IX) and (X), under the conditions of process step (d) Reductive amination – dehydration of an amine and aldehyde followed by reduction of the imine so formed, by a suitable metal hydride reducing agent, usually requiring Lewis acid catalysis in a suitable solvent at room temperature

10

Typically – the amine and aldehyde are mixed together in a suitable solvent such as methanol, ethanol, THF, Et₂O, DCM or DCE and are treated with a suitable reducing agent, such as sodium triacetoxyborohydride or sodium cyanoborohydride and a catalytic quantity of acetic acid, and then stirred at room temperature for 1 –

15

48 hours. Alternatively, the amine and aldehyde are premixed for a time of 1-24

hours in a suitable solvent such as methanol, ethanol, THF, Et₂O, DCM or DCE, followed by the reducing agent such as sodium borohydride, sodium triacetoxyborohydride, sodium cyanoborohydride or lithium aluminium hydride and stirring continued for 1 – 48 hours at a temperature of 0 °C to the reflux temperature of the solvent.

Preferably – a mixture of the amine, 1.05 equivalents of the aldehyde and 1.3 equivalents of sodium triacetoxyborohydride in DCM and catalytic acetic acid was stirred at room temperature for 18 hours.

Compounds of formula (XII) may be prepared by reacting compounds of formula (XI), under the conditions of process step (c) Amide bond formation as described herein.

Preferably – a mixture of the acid and 2.0 equivalents of oxalyl chloride with catalytic DMF in DCM was stirred at 0 °C for 2 hours. The solvent was removed in vacuo and the resultant crude acid chloride treated with 1.0 equivalents of the amine and 4 equivalents of DIPEA in DCM stirring at room temperature for 18 hours.

Compounds of formula (XIII) may be prepared by reacting compounds of formula (XII), under the conditions of process step (b) Ester hydrolysis as described herein.

Compounds of formula (I) may be prepared by reacting compounds of formula (XIV), where R⁹ and R¹⁰ are C₁₋₆ alkyl, or may link together to form a C₄₋₇ containing nitrogen heterocycle, and (XIII), under the conditions of process step (c) Amide bond formation as described herein.

Compounds of formula (I) where R¹, R², R³, R⁴, z and y are as described above, x is 1 and R⁵ is CONR⁶R⁶ may be prepared by the following process as described in Scheme 5:

Scheme 5

- 5 Compounds of formula (XVII) may be prepared by reacting compounds of formula (XVI), where R^6 is as defined herein, and (XV), where P is a suitable nitrogen protecting group, under the conditions of process step (c) Amide bond formation as described herein.
- 10 Suitable nitrogen protecting groups are well described in the art and for example can be found in references such as Greene T.W., Wuts, P.G.M. Protective Groups in Organic Synthesis, Wiley-Interscience and Kocienski, P.J. Protecting Groups, Thieme.

Compounds of formula (XVIII) may be prepared by reacting compounds of formula (XVII), under the conditions of process step (e) Removal of a nitrogen protecting group.

5

The conditions required for removal of the protecting group are often specific to that protecting group; conditions for their removal may be found in references such as Greene T.W., Wuts, P.G.M. Protective Groups in Organic Synthesis, Wiley-Interscience and Kocienski, P.J. Protecting Groups, Thieme. If P is BOC, deprotection is acid catalysed removal of protecting group using a suitable solvent at room temperature

Typically – the protected amine is treated with an excess of an acid such as HCl or TFA at room temperature in a solvent such as 1,4-dioxane, ethyl acetate, DCM or THF.

Preferably – the amine in dichloromethane was treated with 4N HCl in 1,4-dioxane and stirred at room temp for 18 hours.

20 Compounds of formula (XIX) may be prepared by reacting compounds of formula (IX) and (XVIII), under the conditions of process step (d) Reductive amination as described herein.

25 Compounds of formula (I) may be prepared by reacting compounds of formula (II) and (XIX), under the conditions of process step (c) Amide bond formation as described herein

30 Compounds of formula (I) where R^1 , R^2 , R^3 , R^4 , z and y are as described above, x is 1 and R^5 is C_{1-6} alkyl may be prepared by the following process as described in Scheme 6:

5

Scheme 6

Compounds of formula (XIX) may be prepared by reacting compounds of formula (XVIII) and (IX), under the conditions of process step (d) Reductive amination as described herein.

- 5 Compounds of formula (I) may be prepared by reacting compounds of formula (XIX) and (II), under the conditions of process step (c) Amide bond formation as described herein.

- Compounds of formula (I), wherein R^1 is phenyl or Aromatic Heterocycle,
10 comprising an SO_2Me substituent may be prepared by oxidation of the corresponding compound of formula (I) comprising an SMe substituent. Typically, the oxidation is carried out by addition of an oxidant to the sulfide in a solvent at ambient temperature. Preferably, the solvent is dichloromethane and the oxidant is 3-chloroperoxybenzoic acid.

- 15 Compounds of formula (I), wherein R^1 is phenyl or Aromatic Heterocycle, comprising an NR^7R^8 substituent may be prepared by reaction of the corresponding compound of formula (I) comprising an SO_2Me substituent with an amine, HNR^7R^8 . Typically, the reaction is carried out by addition of the amine to the sulfone in an
20 organic solvent at a temperature of $0^\circ C$, followed by warming to room temperature for 2 hours. Preferably, the solvent is THF.

- The compounds of the invention are useful because they have pharmacological activity in mammals, including humans. More particularly, they are useful in the
25 treatment or prevention of a disorder in which elevated levels of oxytocin or an excessive response to a normal level of oxytocin are implicated. Disease states that may be mentioned include sexual dysfunction, particularly premature ejaculation, preterm labour, complications in labour, appetite and feeding disorders, obesity, benign prostatic hyperplasia, premature birth, dysmenorrhoea, congestive
30 heart failure, arterial hypertension, liver cirrhosis, nephrotic hypertension, ocular hypertension, obsessive compulsive disorder and neuropsychiatric disorders.

Sexual dysfunction (SD) is a significant clinical problem which can affect both males and females. The causes of SD may be both organic as well as psychological. Organic aspects of SD are typically caused by underlying vascular diseases, such as those associated with hypertension or diabetes mellitus, by
5 prescription medication and/or by psychiatric disease such as depression. Physiological factors include fear, performance anxiety and interpersonal conflict. SD impairs sexual performance, diminishes self-esteem and disrupts personal relationships thereby inducing personal distress. In the clinic, SD disorders have been divided into female sexual dysfunction (FSD) disorders and male sexual
10 dysfunction (MSD) disorders (Melman *et al* 1999 J. Urology **161** 5-11). FSD is best defined as the difficulty or inability of a woman to find satisfaction in sexual expression. Male sexual dysfunction (MSD) is generally associated with either erectile dysfunction, also known as male erectile dysfunction (MED) and/or ejaculatory disorders such as premature ejaculation, anorgasmia (unable to
15 achieve orgasm) or desire disorders such as hypoactive sexual desire disorder (lack of interest in sex).

PE is a relatively common sexual dysfunction in men. It has been defined in several different ways but the most widely accepted is the Diagnostic and Statistical
20 Manual of Mental Disorders IV one which states:

“PE is a lifelong persistent or recurrent ejaculation with minimal sexual stimulation before, upon or shortly after penetration and before the patient wishes it. The clinician must take into account
25 factors that affect duration of the excitement phase, such as age, novelty of the sexual partner or stimulation, and frequency of sexual activity. The disturbance causes marked distress or interpersonal difficulty.”

30 The International Classification of Diseases 10 definition states:

“There is an inability to delay ejaculation sufficiently to enjoy lovemaking, manifest as either of the following: (1) occurrence of ejaculation before or very soon after the beginning of intercourse (if

a time limit is required: before or within 15 seconds of the beginning of intercourse); (2) ejaculation occurs in the absence of sufficient erection to make intercourse possible. The problem is not the result of prolonged abstinence from sexual activity"

5

Other definitions which have been used include classification on the following criteria:

- Related to partner's orgasm
- Duration between penetration and ejaculation
- 10 • Number of thrust and capacity for voluntary control

Psychological factors may be involved in PE, with relationship problems, anxiety, depression, prior sexual failure all playing a role.

- 15 Ejaculation is dependent on the sympathetic and parasympathetic nervous systems. Efferent impulses via the sympathetic nervous system to the vas deferens and the epididymis produce smooth muscle contraction, moving sperm into the posterior urethra. Similar contractions of the seminal vesicles, prostatic glands and the bulbourethral glands increase the volume and fluid content of
- 20 semen. Expulsion of semen is mediated by efferent impulses originating from the nucleus of Onuf in the spinal cord, which pass via the parasympathetic nervous system and cause rhythmic contractions of the bulbocavernous, ischiocavernous and pelvic floor muscles. Cortical control of ejaculation is still under debate in humans. In the rat the medial pre-optic area and the paraventricular nucleus of the
- 25 hypothalamus seem to be involved in ejaculation.

Ejaculation comprises two separate components – emission and ejaculation. Emission is the deposition of seminal fluid and sperm from the distal epididymis, vas deferens, seminal vesicles and prostate into the prostatic urethra.

- 30 Subsequent to this deposition is the forcible expulsion of the seminal contents from the urethral meatus. Ejaculation is distinct from orgasm, which is purely a cerebral event. Often the two processes are coincidental.

A pulse of oxytocin in peripheral serum accompanies ejaculation in mammals. In man oxytocin but not vasopressin plasma concentrations are significantly raised at or around ejaculation. Oxytocin does not induce ejaculation itself; this process is 100% under nervous control via α 1-adrenoceptor/sympathetic nerves originating
5 from the lumbar region of the spinal cord. The systemic pulse of oxytocin may have a direct role in the peripheral ejaculatory response. It could serve to modulate the contraction of ducts and glandular lobules throughout the male genital tract, thus influencing the fluid volume of different ejaculate components for example. Oxytocin released centrally into the brain could influence sexual behaviour,
10 subjective appreciation of arousal (orgasm) and latency to subsequent ejaculation.

Accordingly, one aspect of the invention provides for the use of a compound of formula (I) in the preparation of a medicament for the prevention or treatment of sexual dysfunction, preferably male sexual dysfunction, most preferably premature
15 ejaculation.

It has been demonstrated in the scientific literature that the number of oxytocin receptors in a woman's body increases during pregnancy, most markedly before the onset of labour. Without being bound by any theory it is known that the inhibition of
20 oxytocin can assist in preventing preterm labour and in resolving complications in labour.

Accordingly, another aspect of the invention provides for the use of a compound of formula (I) in the preparation of a medicament for the prevention or treatment of
25 preterm labour and complications in labour.

Oxytocin has a role in feeding; it stimulates a desire to eat. By inhibiting oxytocin it is possible to reduce the desire to eat. Accordingly oxytocin inhibitors are useful in treating appetite and feeding disorders. Further by reducing appetite, oxytocin
30 inhibitors can help to treat obesity.

Accordingly, a further aspect of the invention provides for the use of a compound of formula (I) in the preparation of a medicament for the prevention or treatment of obesity, appetite and feeding disorders.

Oxytocin is implicated as one of the causes of benign prostatic hyperplasia (BPH). Analysis of prostate tissue have shown that patients with BPH have increased levels of oxytocin. Oxytocin antagonists can help treat this condition.

5

Accordingly, another aspect of the invention provides for the use of a compound of formula (I) in the preparation of a medicament for the prevention or treatment of benign prostatic hyperplasia.

- 10 It is to be appreciated that all references herein to treatment include curative, palliative and prophylactic treatment.

The compounds of the present invention may be coadministered with one or more agents selected from:

15

- 1) One or more SSRIs such as paroxetine, 3-[(dimethylamino)methyl]-4-[4-(methylsulfanyl)phenoxy]benzenesulfonamide (Example 28, WO 0172687), 3-[(dimethylamino)methyl]-4-[3-methyl-4-(methylsulfanyl)phenoxy]benzenesulfonamide (Example 12, WO 0218333), *N*-methyl-*N*-{3-[3-methyl-4-(methylsulfanyl)phenoxy]-4-pyridinyl}methylamine (Example 38, PCT Application no PCT/IB02/01032).
 - 2) One or more local anaesthetics;
 - 3) One or more beta adrenoceptor agonists;
 - 4) one or more α -adrenergic receptor antagonists (also known as
- 25 α -adrenoceptor blockers, α -receptor blockers or α -blockers); suitable α_1 -adrenergic receptor antagonists include: phentolamine, prazosin, phentolamine mesylate, trazodone, alfuzosin, indoramin, naftopidil, tamsulosin, phenoxybenzamine, rauwolfia alkaloids, Recordati 15/2739, SNAP 1069, SNAP 5089, RS17053, SL 89.0591, doxazosin, Example 19 of WO9830560, terazosin
- 30 and abanoquil; suitable α_2 - adrenergic receptor antagonists include dibenarnine, tolazoline, trimazosin, efaroxan, yohimbine, idazoxan clonidine and dibenarnine; suitable non-selective α -adrenergic receptor antagonists include dapiprazole; further α - adrenergic receptor antagonists are described in PCT application

WO99/30697 published on 14th June 1998 and US patents: 4,188,390; 4,026,894; 3,511,836; 4,315,007; 3,527,761; 3,997,666; 2,503,059; 4,703,063; 3,381,009; 4,252,721 and 2,599,000 each of which is incorporated herein by reference;

5) one or more cholesterol lowering agents such as statins (e.g.

5 atorvastatin/Lipitor- trade mark) and fibrates;

6) one or more of vasoactive intestinal protein (VIP), VIP mimetic, VIP analogue, more particularly mediated by one or more of the VIP receptor subtypes VPAC1, VPAC or PACAP (pituitary adenylate cyclase activating peptide), one or more of a VIP receptor agonist or a VIP analogue (eg Ro-125-1553) or a VIP

10 fragment, one or more of a α -adrenoceptor antagonist with VIP combination eg Invicorp, Aviptadil);

7) one or more of a serotonin receptor agonist, antagonist or modulator, more particularly agonists, antagonists or modulators for example 5HT1A (including VML 670), 5HT2A, 5HT2C, 5HT3, 5HT6 and/or 5HT7 receptors, including those

15 described in WO-09902159, WO-00002550 and/or WO-00028993;

8) one or more NEP inhibitors, preferably wherein said NEP is EC 3.4.24.11 and more preferably wherein said NEP inhibitor is a selective inhibitor for EC 3.4.24.11, more preferably a selective NEP inhibitor is a selective inhibitor for EC 3.4.24.11, which has an IC₅₀ of less than 100nM (e.g. omapatrilat, sampatrilat)

20 suitable NEP inhibitor compounds are described in EP-A-1097719; IC₅₀ values against NEP and ACE may be determined using methods described in published patent application EP1097719-A1, paragraphs [0368] to [0376];

9) 9) one or more of an agonist or modulator for vasopressin receptors, such as relcoraptan (SR 49059)

25 10) Apomorphine - teachings on the use of apomorphine as a pharmaceutical may be found in US-A-5945117;

11) Dopamine D2 agonists (e.g. Premiprival, Pharmacia Upjohn compound number PNU95666);

12) Melanocortin receptor agonists (e.g. Melanotan II);

More preferred PDE5 inhibitors for use with the invention are selected from the group:

5-[2-ethoxy-5-(4-methyl-1-piperazinylsulphonyl)phenyl]-1-methyl-3-n-propyl-1,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one (sildenafil);

10 (6R,12aR)-2,3,6,7,12,12a-hexahydro-2-methyl-6-(3,4-methylenedioxyphenyl) - pyrazino[2',1':6,1]pyrido[3,4-b]indole-1,4-dione (IC-351);

2-[2-ethoxy-5-(4-ethyl-piperazin-1-yl-1-sulphonyl)-phenyl]-5-methyl-7-propyl-3H-imidazo[5,1-f][1,2,4]triazin-4-one (vardenafil); and

15 5-[2-ethoxy-5-(4-ethylpiperazin-1-ylsulphonyl)pyridin-3-yl]-3-ethyl-2-[2-methoxyethyl]-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one or 5-(5-Acetyl-2-butoxy-3-pyridinyl)-3-ethyl-2-(1-ethyl-3-azetidiny)-2,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one and pharmaceutically acceptable salts thereof.

A particularly preferred PDE5 inhibitor is 5-[2-ethoxy-5-(4-methyl-1-piperazinylsulphonyl)phenyl]-1-methyl-3-n-propyl-1,6-dihydro-7H-pyrazolo[4,3-d]pyrimidin-7-one (sildenafil) (also known as 1-[[3-(6,7-dihydro-1-methyl-7-oxo-3-propyl-1H-pyrazolo[4,3-d]pyrimidin-5-yl)-4-ethoxyphenyl]sulphonyl]-4-methylpiperazine) and pharmaceutically acceptable salts thereof. Sildenafil citrate is a preferred salt.

iii) Maintenance of the Oxytocin Receptor - CHO Cells

- 10 • The cell line is routinely maintained as a continuous culture in 50 ml growth medium in 225 cm² flasks.
- Cells are passaged by removing the medium from the monolayer, washing with PBS and incubating with Trypsin until cells show signs of dissociation. After knocking the cells from the bottom of the flask, cells
- 15 are resuspended in growth medium and seeded into 225 cm² flasks at a concentration of 8x10⁵ cells/flask.

IV) GROWTH OF CELLS IN ROLLER BOTTLES

- 20 • Cells are seeded into 10 x 850 cm² roller bottles at a density of 6 x 10⁶ cells/bottle and are allowed to reach near confluence.
- Cells are removed from the bottles using trypsin, as described above, and the cells are seeded into 100 x roller bottles (i.e. 1:10 split ratio).
- Cells are again allowed to reach near confluence before removing the growth
- 25 medium, adding 40 ml PBS/ bottle and harvesting by scraping using the CellMate. The cell suspension is then centrifuged at 2000 rpm, washed in PBS, centrifuged again and pellets are frozen in aliquots at –80°C.

v) Membrane Preparations

- 30 • Cell pellets are retrieved from the freezer, thawed on ice and resuspended in 3 ml of membrane prep buffer per ml packed cell volume.

- The suspension is then homogenised using a mechanical homogeniser for several bursts of 5 secs on ice before centrifuging at 25,000 x g for 30 mins.
- After resuspending the pellet in 1 ml of freezing buffer per 1 ml of the original packed cell volume the suspension is briefly homogenised to remove small lumps. Protein concentrations are then measured and the membrane suspension is finally frozen in aliquots at a minimum of 5 mg/ml at -80°C .

vi)

Assay

- Membranes are thawed on ice before diluting to 1 mg/ml in assay buffer. SPA beads are resuspended at 50 mg/ml in assay buffer. From these concentrations, beads are pre-coupled with membranes by incubating 30 μg of protein per mg of bead on a top-to-tail shaker for 2 hours at 4°C . The bead/membranes are then centrifuged at 2000 rpm for 10 mins and the pellet is resuspended at 3 mg/ml.
- All manipulations of the ^{125}I -OVTA are carried out using tips that have been silanised using SigmaCote. All bottles and tubes are also silanised. The ^{125}I -OVTA is diluted in 1ml assay buffer per 50 μCi of lyophilised ligand. A 5 μl sample is then counted in duplicate using liquid scintillation counting (protocol 61 on Wallac Counter) and the concentration of the ligand is calculated (see example below). This is to overcome any loss of ligand due to stickiness. Using the measured concentration, the ^{125}I -OVTA is diluted to 0.3 nM in assay buffer.

Example:

If 5 μl gives 500000 dpm and the specific activity of the ligand is 2200Ci/mmol then:

$$\text{Concentration} = 500000 / (2.2 \times 2200 \times 5) \text{ nM}$$

20 µl of the bead/membrane preparation is added to the prepared Optiplates using the Multi-drop. The bead/membrane preparation is kept in suspension using a stirring flask. 20 µl of the ¹²⁵I-OVTA is then added to each well of the Optiplate
5 using the Multi-drop. Following a 4 hour incubation at room temperature, the plates are counted using the TopCount NXT for 30s/well.

The compounds of the present invention all exhibit better than 70% inhibition of oxytocin at 10⁻⁶M.

The compounds of the formula (I) can be administered alone but will generally be administered in admixture with a suitable pharmaceutical excipient, diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice.

20

The present invention provides for a composition comprising a compound of formula (I) and a pharmaceutically acceptable diluent or carrier.

For example, the compounds of the formula (I) can be administered orally, buccally
25 or sublingually in the form of tablets, capsules, ovules, elixirs, solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed-, modified-, sustained-, pulsed- or controlled-release applications.

Such tablets may contain excipients such as microcrystalline cellulose, lactose,
30 sodium citrate, calcium carbonate, dibasic calcium phosphate and glycine, disintegrants such as starch (preferably corn, potato or tapioca starch), sodium starch glycollate, croscarmellose sodium and certain complex silicates, and granulation binders such as polyvinylpyrrolidone, hydroxypropylmethylcellulose (HPMC), hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally,

lubricating agents such as magnesium stearate, stearic acid, glyceryl behenate and talc may be included.

5 Solid compositions of a similar type may also be employed as fillers in gelatin capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or high molecular weight polyethylene glycols. For aqueous suspensions and/or elixirs, the compounds of the formula (I) may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as water, ethanol, propylene
10 glycol and glycerin, and combinations thereof.

The compounds of the formula (I) can also be administered parenterally, for example, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intraurethrally, intrasternally, intracranially, intramuscularly or
15 subcutaneously, or they may be administered by infusion techniques. For such parenteral administration they are best used in the form of a sterile aqueous solution which may contain other substances, for example, enough salts or glucose to make the solution isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if necessary. The preparation of
20 suitable parenteral formulations under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known to those skilled in the art.

The compounds of formula (I) can also be administered intranasally or by inhalation and are conveniently delivered in the form of a dry powder inhaler or an aerosol
25 spray presentation from a pressurised container, pump, spray, atomiser or nebuliser, with or without the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA 134A [trade mark]) or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EA [trade mark]), carbon dioxide or
30 other suitable gas. In the case of a pressurised aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray, atomiser or nebuliser may contain a solution or suspension of the active compound, e.g. using a mixture of ethanol and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate.

Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated to contain a powder mix of a compound of the formula (I) and a suitable powder base such as lactose or starch.

- 5 Alternatively, the compounds of the formula (I) can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a gel, hydrogel, lotion, solution, cream, ointment or dusting powder. The compounds of the formula (I) may also be dermally or transdermally administered, for example, by the use of a skin patch. They may also be administered by the pulmonary or rectal
10 routes.

- They may also be administered by the ocular route. For ophthalmic use, the compounds can be formulated as micronised suspensions in isotonic, pH adjusted, sterile saline, or, preferably, as solutions in isotonic, pH adjusted, sterile saline,
15 optionally in combination with a preservative such as a benzylalkonium chloride. Alternatively, they may be formulated in an ointment such as petrolatum.

- For application topically to the skin, the compounds of the formula (I) can be formulated as a suitable ointment containing the active compound suspended or
20 dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil,
25 sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

- The compounds of the formula (I) may also be used in combination with a cyclodextrin. Cyclodextrins are known to form inclusion and non-inclusion
30 complexes with drug molecules. Formation of a drug-cyclodextrin complex may modify the solubility, dissolution rate, bioavailability and/or stability property of a drug molecule. Drug-cyclodextrin complexes are generally useful for most dosage forms and administration routes. As an alternative to direct complexation with the drug the cyclodextrin may be used as an auxiliary additive, e.g. as a carrier, diluent

or solubiliser. Alpha-, beta- and gamma-cyclodextrins are most commonly used and suitable examples are described in WO-A-91/11172, WO-A-94/02518 and WO-A-98/55148.

Solutions of 4-chlorobenzylamine (708mg, 5mmol) in methanol (10ml), followed by o-tolualdehyde (601mg, 5mmol) in methanol (10ml) then the compound from preparation 6 (916mg, 5mmol) in methanol/cyclohexane (95:5, by volume) were added consecutively to a suspension of 2-aminonicotinic acid (691mg, 5mmol) in methanol (20ml), and the mixture stirred at 50°C for 7 hours, then at room temperature for a further 18 hours. The reaction mixture was concentrated under reduced pressure, the residue dissolved in a solution of hydrochloric acid in tetrahydrofuran (25ml, 0.6M) and the reaction stirred at room temperature for 24 hours. The mixture was evaporated under reduced pressure, the residue suspended in dichloromethane (200ml), triethylamine added, until dissolution occurred, then the solution washed with saturated aqueous ammonium chloride solution (2x50ml). The organic solution was then dried (MgSO₄) and evaporated under reduced pressure. The crude product was purified by column chromatography on silica gel using a gradient elution of dichloromethane:methanol:triethylamine (100:0:0 to 90:10:1) to afford the title compound, 968mg.

Solutions of 4-methylbenzylamine (50 μ l, 0.6M in methanol), benzodioxane aldehyde (100 μ l, 0.3M in methanol) and the isocyanate from preparation 6 (50 μ l, 0.6M in methanol) were added to the appropriate acids (30 μ mol). The reactions were sealed and agitated at rt for 18 hours then heated at 50°C for 3 hours. The solvents were removed under reduced pressure, hydrochloric acid in tetrahydrofuran (500 μ l, 0.6M) was added, and the vessels were resealed and agitated again at room temperature for a further 24 hours. The solvents were

removed under reduced pressure, the residues dissolved in dimethyl sulphoxide (500 μ l) and purified by HPLC, using a Phenomonex Luna 150x10mm, 10 μ m column, in acetonitrile:0.1% aqueous diethylamine, at 8mlmin⁻¹, at 225nM, using the following gradient.

Examples 10 to 24

The required acids (R^1CO_2H) (200 μ l, 0.25M solution in methanol), (1-methyl-2-pyrrolidinone added to aid dissolution where necessary), followed by the amines (R^2NH_2) (100 μ l, 0.5 M solution in methanol) were transferred to 96 well plates. Solutions of the appropriate aldehydes R^3COH (100 μ l, 0.5 M solution in methanol)

were prepared and then added, followed by a solution of the compound from preparation 6 (100 μ l, 0.5M in cyclohexane:methanol, 1:19, by volume), and the plates sealed. The plates were heated at 50°C for 24 hours under a nitrogen atmosphere, then allowed to cool and the solvents removed *in vacuo*.

- 5 A solution of hydrochloric acid in tetrahydrofuran (0.5ml, 0.6N) was added and the reactions sealed and shaken at room temperature for 72 hours. The solvent was removed *in vacuo*, and the residues neutralised by the addition of triethylamine (50 μ l), then dissolved in methyl sulphoxide/water (approx. 0.5ml, 90:10, by volume). The solutions were purified by HPLC, on a Phenomenex Magellen 5 μ C18 column (150x10mm), using an elution gradient of acetonitrile:0.05% aqueous trifluoroacetic acid (15:85 to 90:10 to 98:2) at 6mlmin⁻¹ and detected at 210nm, and the solvents evaporated *in vacuo*, to afford the title compounds.

The final compounds were analysed on a Phenomenex Magellen 5 μ C18 column (30x4.6mm), using acetonitrile:0.05% aqueous trifluoroacetic acid, at a rate of

- 15 3mlmin⁻¹, at 225nM and 255 nM, using the following gradient:

5

N-[3-Amino-1-(3-methoxyphenyl)-3-oxopropyl]-4-methyl-N-(4-methylbenzyl)nicotinamide

A solution of the acid from preparation 13 (176mg, 0.42mmol), O-(1H-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (157mg, 0.42mol) and N-ethyl-diisopropylamine (147μl, 0.84mmol) in dichloromethane (20ml) was stirred at room temperature for an hour. 0.88 Ammonia (0.5ml) was added and the reaction stirred at room temperature for 18 hours. The mixture was washed with sodium bicarbonate solution (20ml), water (20ml) and brine (20ml) then dried (Na₂SO₄) and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel using an elution gradient of dichloromethane:methanol:0.88 ammonia (100:0:0 to 97.5:2.5:0.25) to afford the title compound, 79mg.

EXAMPLE 241

15 2-Amino-N-[(1S)-3-amino-3-oxo-1-phenylpropyl]-N-(4-methylbenzyl)nicotinamide

The amine from preparation 11 (100mg, 0.37mmol), 2-aminonicotinic acid (47.1mg, 0.34mmol) and O-(1H-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (141mg, 0.37mol) were added to a solution of N-

ethyldiisopropylamine (195 μ l, 1.125mmol) in N,N-dimethylformamide (2ml), and the solution stirred at room temperature for 18 hours, then at 85°C for a further 48 hours. The cooled mixture was concentrated under reduced pressure and the residue partitioned between sodium carbonate solution (10ml) and ethyl acetate (10ml). The layers were separated, the organic phase washed with water (10ml) and brine (5ml), dried (Na₂SO₄) and evaporated under reduced pressure. The residual brown oil was purified by column chromatography on silica gel using an elution gradient of dichloromethane:methanol (100:0 to 90:10) to afford the title compound as a brown oil, 25.1mg.

- 5-Chloro-2-methylthio-N-[2-amino-1-{1,4-benzodioxan-6-yl}-2-oxoethyl]-N-(4-methylbenzyl)pyrimidine-4-carboxamide

- To a solution of methyl-5-chloro-2-methylthiopyrimidine-4-carboxylate (1.0g, 4.88mmol) in methanol (40ml) was added 4-methylbenzylamine (0.71g, 5.86mmol), 1,4 benzodioxan-6-carboxaldehyde (0.96g, 5.86mmol) and 4-phenylcyclohex-1-enylisonitrile (1.075g, 5.86mmol). After 3 hours the solvent was evaporated and the residue was dissolved in 10ml of 1.2N HCl in THF. After 1 hour the solvent was evaporated and the residue dissolved in ethyl acetate (100ml). This solution was washed with water (50ml), saturated NaHCO₃ solution (50ml) and brine (50ml),

dried over MgSO_4 , filtered and evaporated. The residue was purified by chromatography on silica gel (50gm), eluting with a gradient of pentane-ethyl acetate (9:1 to 4:6 in 10% increments of EtOAc) to afford the title compound as a solid, 2.28g, (93%).

Preparation 1

2-Methylamino-nicotinic acid

10 Methylamine hydrochloride (8.6g, 128mmol) was added portionwise to a mixture of
2-chloronicotinic acid (10.0g, 64mmol), potassium carbonate (35.4g, 256mmol) and
copper (I) bromide (920mg, 6.4mmol) in N,N-dimethylformamide (100ml), and the
reaction heated at 100°C for 18 hours, then cooled. The resulting precipitate was
removed by filtration, washing through with additional methanol and the filtrate
evaporated under reduced pressure. The residue was redissolved in 2N sodium
15 hydroxide solution (200ml), washed with diethyl ether (4x80ml), then the pH of the
aqueous solution adjusted to 6, using concentrated hydrochloric acid. This aqueous
solution was evaporated under reduced pressure, the residue dissolved in
methanol, poly(4-vinylpyridine), 2% cross-linked (5g) was added, and the mixture
stirred at room temperature for 18 hours. The resin was removed by filtration, and

the procedure then repeated. The solution was evaporated under reduced pressure, and the solid recrystallised from ethanol, to afford the title compound, 5.2g.

Potassium carbonate (9.21g, 66.6mmol) was added to a mixture of 2-chloronicotinic acid (5.0g, 31.7mol), ethylamine hydrochloride (5.18g, 63.4mmol) and copper (I) bromide (450mg, 3.17mmol) in N,N-dimethylformamide (50ml), and the reaction heated at 100°C for 1.5 hours, then cooled. The resulting solid was removed by filtration, and the filtrate evaporated under reduced pressure. The residual blue/green solid was triturated with acetone, and the resulting solid filtered off and dried *in vacuo* to afford the title compound.

15

The filtrate was evaporated under reduced pressure, the residue triturated with diethyl ether and the solid filtered and dried *in vacuo*, to afford additional product,

2.2g in total.

Preparation 3

2-Benzylamino-nicotinic acid

Potassium carbonate (4.82g, 34.9mmol) was added to a mixture of 2-chloronicotinic acid (5.0g, 31.7mol), benzylamine (3.47ml, 31.7mmol) and copper (I) bromide (450mg, 3.17mmol) in N,N-dimethylformamide (50ml), and the reaction
5 heated at 100°C for 2 hours, then cooled. The resulting solid was filtered off and the filtrate evaporated under reduced pressure. The residue was partitioned between 4N sodium hydroxide solution (25ml) and dichloromethane (25ml) and the layers separated. The organic solution was extracted with water (2x), and the combined aqueous solutions, neutralised using concentrated hydrochloric acid. The
10 resulting solid was filtered off, washed with cold water and dried *in vacuo* at 50°C, to afford the title compound, 1.6g.

Preparation 4

2-([3-(4-Morpholinyl)propyl]amino)nicotinic acid

3-(4-Morpholino)-1-propylamine (9.23g, 40mmol) was added to a solution of 2-chloronicotinic acid (5g, 32mmol), potassium carbonate (4.42g, 3mmol) and
20 copper (I) bromide (460mg, 3.2mmol) in N,N-dimethylformamide, and the mixture stirred at 110°C for 21 hours. The cooled mixture was filtered and the filtrate concentrated under reduced pressure, and the residue azeotroped with toluene.

The residue was dissolved in methanol (40ml), and poly(4-vinylpyridine) 2% cross-linked was added, the mixture stirred for an hour, then filtered. The filtrate was concentrated under reduced pressure, the residue dissolved in a minimum volume of dichloromethane, and added dropwise into diethyl ether (250ml), yielding an oil.

- 5 The solvent was decanted off, the oil re-dissolved in a minimum volume of dichloromethane and again added dropwise to diethyl ether. The resulting precipitate was filtered and dried to afford the title compound, 4.3g.

2-Fluoro-5-formylbenzonitrile

- 15 *iso*-propyl magnesium bromide (18ml, 1M in tetrahydrofuran, 18mmol) was added dropwise to an ice-cooled solution of 5-bromo-2-fluorobenzonitrile (3g, 15.1mmol) in tetrahydrofuran (25ml), and once addition was complete, the mixture was allowed to warm to room temperature and stirred for a further 2 hours. N,N-Dimethylformamide (3.5ml, 45.2mmol) was added and the reaction stirred for 3
- 20 hours. Water was added and the mixture extracted with ethyl acetate (3x). The combined organic extracts were washed with 6% aqueous magnesium sulphate solution, and brine, then dried (Na_2SO_4) and concentrated under reduced pressure. The product was purified by column chromatography on silica gel using an elution gradient of ethyl acetate:hexane (10:90 to 20:80) to afford the title compound as a

(4-Isocyano-cyclohex-3-enyl)-benzene

Potassium *tert*-butoxide (34.3g, 306mmol) was added portionwise to a solution of
5 4-phenyl-1-formamidocyclohexene (13.6g, 68mmol) (Bilorg. Med. Chem; 8; 6;
2000; 1343) in *tert*-butanol (150ml), and the mixture stirred for 2 hours, with
sufficient heating to ensure solution. Phosphorous oxychloride (7.82g, 51mmol)
was added dropwise, with cooling of the reaction vessel, and once addition was
complete, the reaction was stirred at room temperature for 24 hours. TLC analysis
10 showed starting material remaining, so additional potassium *tert*-butoxide (3.8g,
34mmol) and phosphorous oxychloride (1.57ml, 17mmol) were added, and the
reaction stirred for a further 45 minutes. The mixture was concentrated under
reduced pressure, the residue poured into brine (500ml) and extracted with
dichloromethane (100ml, 3x50ml). The combined organic solutions were washed
15 with water (100ml), brine (200ml), dried (Na₂SO₄) and evaporated under reduced
pressure. The crude product was purified by column chromatography on silica gel
using hexane:ethyl acetate (90:10) as eluant to afford the title compound, 5.8g.
